

LABORATOIRE D'INFORMATIQUE FONDAMENTALE ET APPLIQUÉE DE TOURS

EA 6300 – ERL CNRS 7002

Laboratory of Fundamental and Applied Computer Science of Tours

Tours/Blois - Loire valley - France

2

CITY OF TOURS

- 130,000 citizens (≈ 300,000 in the urban area)
- 30 TGV directs/day to/from Paris (1h)
- 300 km of bike lanes
- 1,200 public bikes
- A 360 km public transport network

THE LOIRE VALLEY & BLOIS

The heart of the Loire Valley: an exiting region to discover

- Les chateaux de la Loire
- Les vignobles de la Touraine

Associated with Engineering schools

3

POLYTECH GROUP / NETWORK

- Group of **14 graduate school of engineering**
- More than **13 %** of engineer degree in France
- 14,000 engineering students
- 3000 graduates every year
- 125 research labs
- 1,200 Ph.D. students

UNIVERSITY OF TOURS

- **27 000** students
- Pluridisciplinary university
- **More than 1500** faculty members
- **73** Research labs

INSA GROUP / NETWORK

- Group of **6 graduate school of engineering**
- Around **10 %** of engineer degree in France
- 12,400 engineering students
- 1100 graduates every year
- 53 research labs
- 1,200 Ph.D. students

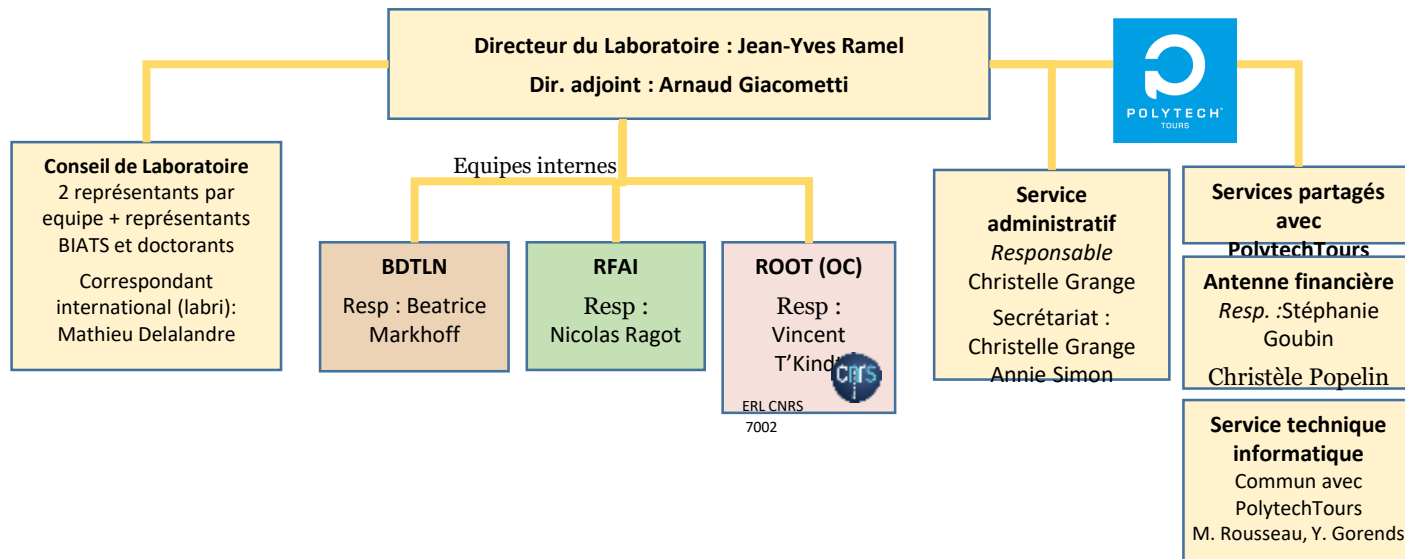

Organization LIFAT (EA 6300 – ERL 7002)

- ILIAD3 is a center for technology transfer associated to the LIFAT.
- Development and industrial transfers of prototypes produced by researchers
- Digitization and processing of 3D data
- Consultancy and training

ILIAD3 center

Main Application Domains

Application domains

Digital Humanities

Transcription tools for historical books, data warehouse and web services for cultural heritage, optimization of touristic paths, virtual visits, etc.

Health and Disability

Medical image analysis, visualization and mining of medical data, optimization of patient pathways, interactive devices for disability, etc.

Partners & Projects

H2020 COST PARSEME

The federation aims to:

- enhance and improve the visibility of IT research activities in the Center-Val de Loire Region
 - generate and promote research projects at the regional, national and international levels
 - boost the research activity in both units and encourage their collaborations
- build a pole of excellence in the efficient, reliable and secure acquisition and processing of digital information
- The ICVL is structured in 3 main research areas:
 - Massive, complex or heterogeneous data
 - Algorithms and optimization
 - Security, reliability and performance

Some examples of research projects

16

- Interactive transcription for Digital Humanities
- Medical Image Analysis
- Emotions Analysis
- Surgical operations with Augmented Reality
- Help for communication with NLP
- Optimisation of city evacuation
- Production and Planning of Chemotherapies
- Etc...

Interactive transcription for Digital Humanities

17

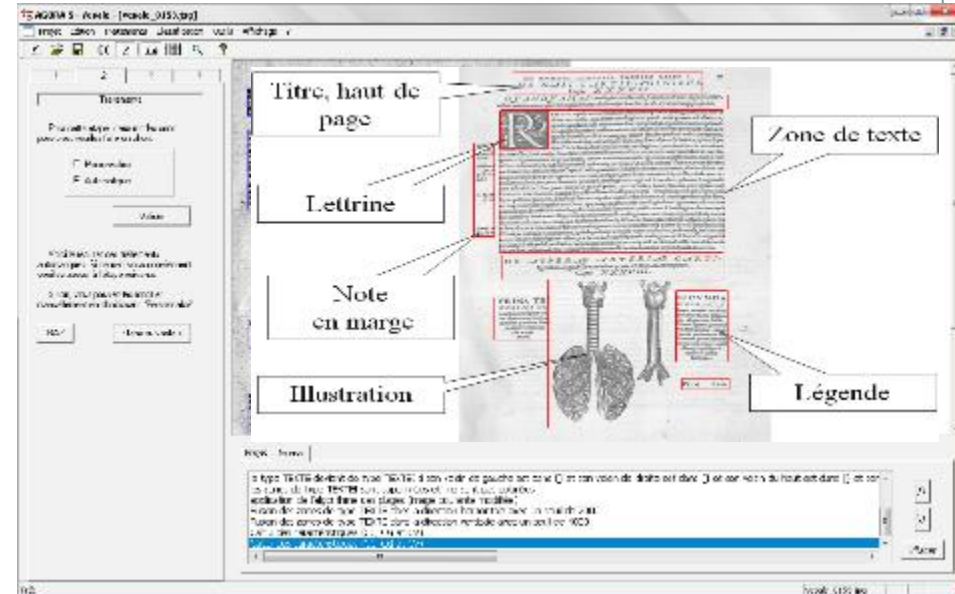

- **Paradiit**: Google Award in DH
- Agora software → Interactive extractions of Regions of Interest (EoC)
 - Generation of XML files describing the structure of images
 - First version in 2011 (CESR)

- Batyr dataset
- Bases of dropcaps (+ de 24000)

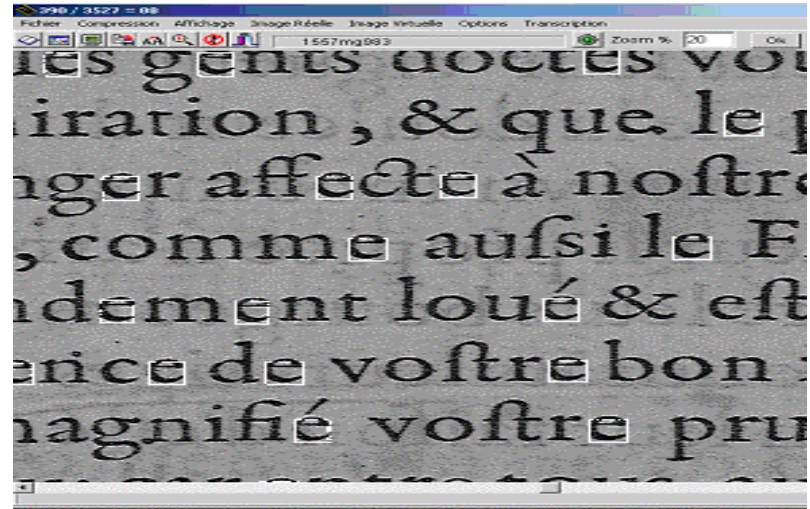

- Bases of portraits (+ de 1500)

Intreactive transcription for Digital Humanities

18

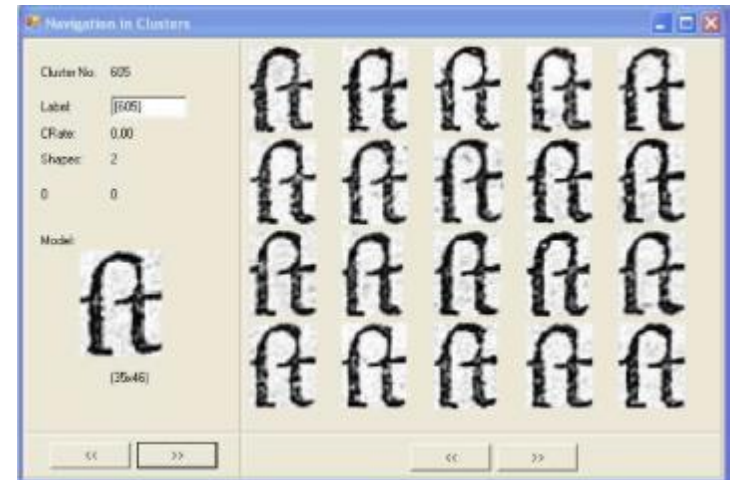

- Redundancy analysis of EoC (shapes)
 - Extraction and Clustering of Similar shapes
 - Without a priori or knowledge about the semantics of these shapes
- The constraints to be respected are:
 - Produce very homogeneous clusters → Prohibit confusion and bad classifications
 - Produce a minimal number of clusters
- Which shapes?
 - Connected Components [Lebourgeois95]
 - Words [Kluzner & Al2009]
 - Other (glyphs) [Roy & Al2011]
- Redundancy rate > 80%

Interactive transcription for Digital Humanities

19

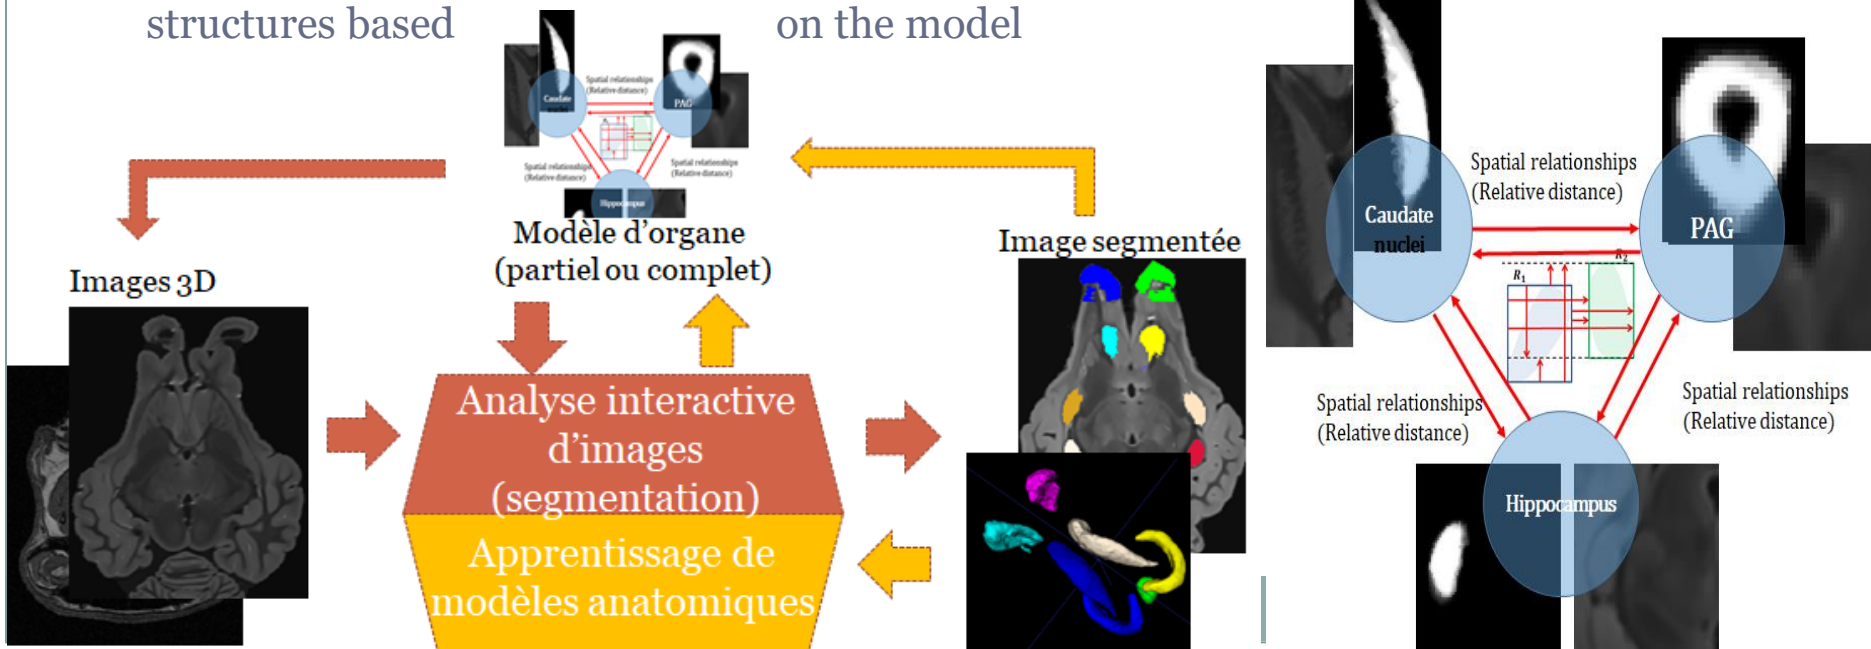

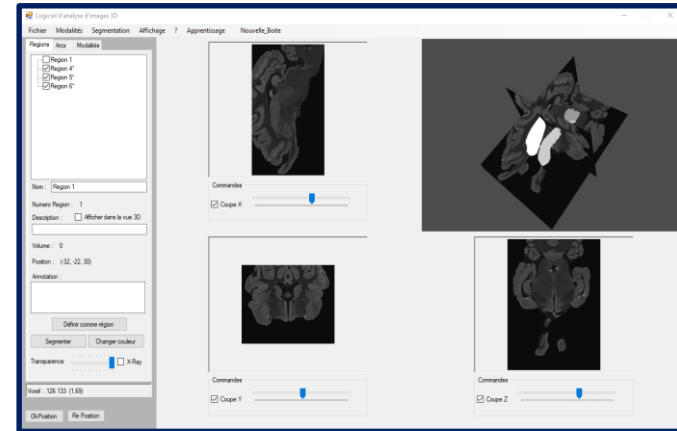

- Cluster Analysis Interface (Retro) →
- EoC characterization
 - Pixels (NdG? B & W?)
 - Geometric moments (Zernike)
- Comparison method
 - Can not compare all shapes together
 - Choice of method / distance (BIRCH)
- Cluster representatives
 - Computation time and complexity
 - 1 book = several days → Parallelism
 - M. of files → Big data

Medical images analysis

20

- Proposition of **SILA 3D** framework
 - Segmentation of 3D MRI or scanner images
 - Genericity: Brain, heart, ...
- Based on a combination between local atlases and a topological graph (the model)
 - Automatic learning of the model of the organ
 - Incremental & interactive extraction of anatomical structures based on the model

Medical images analysis

21

- Some results

Emotion Analysis

22

- Reconstruction of a facial expression space by:
 - Video analysis (extraction of characteristics, use of Gaussian Processing to build the latent space)
 - Analysis of physiological signals (heartbeat, sweating level, dilation of the pupil)
- Data acquisition by specific sensors
- Detection of physiological signals by video analysis

Surgical operations with Augmented Reality

23

Putting shoulder prosthesis using augmented reality glasses

- Before and during the operation
- Visualize 3D anatomical models of the prosthesis or the patient shoulder to prepare the different stages of the surgical procedure
- Visualize anatomical models, additional guides or information to facilitate the intervention

Help in communication with NLP

24

Heavily disabled people

- Cerebral palsy (post-stroke), amyotrophic lateral sclerosis, tetraplegia ...
- No more access to the physical keyboard → virtual keyboard → slow input

Linguistic Prediction

- Dynamic reorganization of the keyboard to accelerate access to the correct letter.
- Lexical prediction: predict the right word to avoid its keyboarding

Help in communication with NLP

25

Statistical language model

- *Design for all* – Same goal as prediction of words on smartphone, but advanced prediction model
- Automatic learning on specific corpus

$$\lambda \cdot P_{\text{général}}(w_i) + (1 - \lambda) \cdot P_{\text{utilisateur}}(w_i)$$

General Model
(N-gram)

Wikipedia, Le Monde....

User Model
(N-gram)

Saisies utilisateur

$$P'(w_i) = \frac{P_{base}(w_i)^{\lambda} \cdot P_{LSA}(w_i)^{(1-\lambda)}}{\sum_{j=1}^n P_{base}(w_j)^{\lambda} \cdot P_{LSA}(w_j)^{(1-\lambda)}}$$

Semantic Adaptation

Latent Semantic Analysis (LSA) or word embedding (**deep learning**)

Results

- Quality of Prediction: Letter Saving Economy Rate

Modèle	Unigram	Bigram	Trigram	+ sémantique
KSR	43.9 %	51.2 %	55.8 %	57.8 %

- Used by numerous patients (Centre de Kerpape, Garches)

Optimisation of city evacuation

26

- Models and tools for planning a city evacuation in case of natural disaster

Zone sinistrée

Provide decision support tools for evacuation (ANR/BMBF DSS_EVAC_LOGISTIQUE).

Theoretical models applied to cities of Nice (Fr) and Kaiserslautern (Ge)

Can we develop optimization algorithms for the assignment and transport of people by bus and car ... guaranteeing rapid and secure evacuation?

Problems

- Determine the location of rescue centers [location and transport models],
- Assign the population to the rescue centers [scheduling / assignment models],
- Plan bus and car transportation from assembly points to rescue centers [transport models],

- Development of complex scheduling and transport models, resulting from a dialogue with the actors in the field,
- Proposed efficient optimization algorithms to plan the evacuation of 35,000 people (Nice),
- Franco-German collaboration (University of Tours / University of Kaiserslautern),
- Scientific assessment: 6 international journals, 11 international conferences, 7 national conferences,
- Technological balance: realization of a Visual Flow software prototype..

Contributions

Production and Planning of Chemotherapies

27

- **A Regional project**
 - In collaboration with Tours Hospital (UBCO) and a company (Eticsys)
 - UBCO is in charge of producing all chemotherapies (over 35,000 / year). Average cost of a chemo: 2000 €
- **Stages related to the production of chemo**
 - Prescription by the doctor
 - Validation of the patient's condition to take the chemo → launch of the production of chemo
 - Sterilization of cytotoxic drugs to constitute chemo → Constitution of chemo
 - Chemo analysis
 - Delivery of the chemo to the hospital
 - Administration of chemo to the patient

Production and Planning of Chemotherapies

28

- **Dynamic problem + Strong constraints (real time)**
 - delay of less than 1h30 for the production starting from the validation (no production in advance possible)
 - duration of operation is different for each chemo
 - delays of chemical stabilities to be respected
 - several delivery men
- **Decision variables: which insulator, which operator, at what time, in what order, when to deliver and in what order, how many tours, etc.**
 - Mathematical modeling → constraint programming and Meta-heuristics
 - Tool currently in production → Integration into a software suite (OncoSuite) integrating traceability management and production monitoring

The LIFAT in a few words...

DATA SCIENCE, ARTIFICIAL INTELLIGENCE, DECISION SUPPORT, OPTIMISATION
without forgetting the Human
